

**"A 64 Slice CT? It might not look
much different but it is!"**

Shannon Brown, CEO

Huntsville Memorial Hospital is pleased to announce that in our commitment to provide "up to the minute" technology for our patients, we have acquired a new **64 slice CT system**. The system will help obtain the information needed to diagnose disease and life-threatening illnesses, including cardiovascular disease, chest pain, and stroke.

Requiring little more than an injection of x-ray contrast through an IV placed in the arm, 64-slice CT angiography allows physicians to view even the smallest of arteries in the brain, heart, and peripheral vascular system. 3-Dimensional reconstructed images allow physicians and their patients to easily review and understand the finding of the CT scan.

Scan times are also much shorter (usually 5-13 seconds); which means that even patients with severe pulmonary disease and congestive heart failure can hold their breath for the required length of time.

Huntsville Memorial Hospital is proud to bring these advantages to our patients. For questions regarding scheduling, please call 936*435*7577 or visit our website www.huntsvillememorial.com.

Down to earth and up to the minute.
